

Test Assignment: People Management & Resourcing MVP

Overview

Build an MVP of an internal People Management & Resourcing web application for an engineering organization (500+ employees, distributed across units and projects).

The system has three types of users with different views:

- **Unit Manager (UM)** — manages a group of engineers, owns their profiles, fulfills resourcing requests.
- **Sales / Delivery Manager (DM)** — creates resourcing requests, reviews proposed candidates, approves or rejects assignments.
- **Employee** — sees and partially edits their own profile.

No external integrations are required in the scope of MVP. All data is created and stored within the system itself. Use seed/mock data where convenient.

Stack is at your discretion. Focus on a clean, fast UI, a coherent data model while establishing the most efficient software development process using a modern, AI-driven development workflow.

1. Manager Dashboard

A personal landing page for the Unit Manager.

- Summary widgets: headcount of subordinates, active risks, open action items, active resourcing requests.
- List of the manager's own action items, sorted by due date, with overdue highlighting.
- Quick navigation to the main sections (subordinates list, custom lists, resourcing, risks).

2. Subordinates List

A page listing all employees subordinate to the current manager.

- Tabular view with core columns (name, position, grade, project/status, risk level).
- Basic sorting and filtering.
- Row click opens the Employee Profile.

3. Custom Lists

The manager can define **custom fields** on employee profiles (e.g., text, number, date, single-select, boolean), and build **custom lists** based on them.

Requirements:

- A convenient builder UI to create a custom list: pick which employees are included (by filter), and choose which fields appear as **columns** and which are used as **filters**.
- Any custom field can be used as a filter, a column, or both.
- Columns must be **inline-editable** directly in the list — editing a cell updates the underlying field value on the employee's profile.
- Each saved custom list is displayed as a **tab** on the Custom Lists page. Multiple lists coexist as multiple tabs.
- Lists are owned by the manager who created them and can be shared to other managers.

Example use cases the manager should be able to build with this: a "booked" list, a manually-maintained "bench" list, a "needs a conversation" list — each driven by custom fields/tags or system data.

4. Employee Profile (managerial view)

Central detail page for a person, visible to their managers.

Must include:

- basic info: name, position, grade, birthday, contacts (personal, emergency), address
- employee type (FTE / Subcontractor)
- English level
- IDP document reference
- Risks (current level + history)
- HR/management notes
- feedbacks
- scheduled leaves
- documents (e.g., contract, CV, joining interview feedback)
- **assignment history** — the list of assignment attempts for this person (see §6); separate from project history

- **project history** — the list of projects the person worked on; separate from assignment history. A successful assignment may lead to a project, in which case both items exist: the successful assignment (in assignment history) and the resulting project (in project history).
- action items — manager can assign tasks to the person
- custom fields (see §3)

5. Profile Sharing

The manager can generate a **shareable view** of an employee's profile for users without direct hierarchical access (e.g., a Sales manager).

- The manager selects which sections of information are included in the shared view (granular, per-section).
- The shared view is accessible via a generated link.
- Sensitive sections are excluded by default and must be explicitly enabled.

6. Resourcing

A request → candidate → approval workflow across three views.

6.1 Request creation (Sales / DM view)

The Sales manager or DM creates a **resourcing request** for a person, specifying:

- vacancy details and requirements
- expected compensation level
- duration / term
- workload (allocation %)

6.2 Request fulfillment (UM view)

The Unit Manager sees a list of incoming requests assigned to them. For a given request, the UM can:

- select among available specialists from their unit, **or**
- add a link to an external candidate's profile (a reference URL to a candidate profile, e.g. in a recruitment system),
- attach the chosen candidate(s) to the request,
- submit for DM approval.

6.3 Request review (Sales / DM view)

The Sales manager / DM sees a list of the requests they created. In the request detail, they see the proposed candidates, each with a link to the relevant profile:

- the shared profile of an internal employee (see §5), or
- the external candidate profile URL.

For each proposed candidate, the DM can either:

- **approve** the assignment, or
- **reject** it and provide feedback in the system — a reason why the candidate is not a fit.

6.4 Assignment history

Each assignment attempt (proposed → approved/rejected, with feedback) is recorded and displayed:

- in the manager's **Resourcing → Assignments** sub-page (history of all their assignment attempts), and
- in the **employee's profile** — in the assignment history list (§4), separate from project history.

7. Employee Profile (personal view)

A page each employee sees for themselves, where they can:

- see and update their own contact info
- see action items assigned to them by their manager / PP
- see and update their IDP statuses
- upload certificates and similar documents
